

cymactive™

Putting men in control of their urinary retention through a magnet-operated valved urethral catheter.

✓ Confidence

✓ Control

✓ Dignity

Redefining Catheter Care for Men

cymactive™ is an innovative, patient-controlled urinary catheter that transforms long-term catheter care for men with chronic urinary retention. Designed for dignity, control, and independence, **cymactive™** empowers the individual while supporting goals to reduce infections, wastage and healthcare costs.

Tackling the challenges of traditional catheterisation

- Designed to facilitate the natural filling and voiding of the bladder to maintain bladder function.
- Works with urethra's natural barrier against infection to minimise the causes of UTIs.

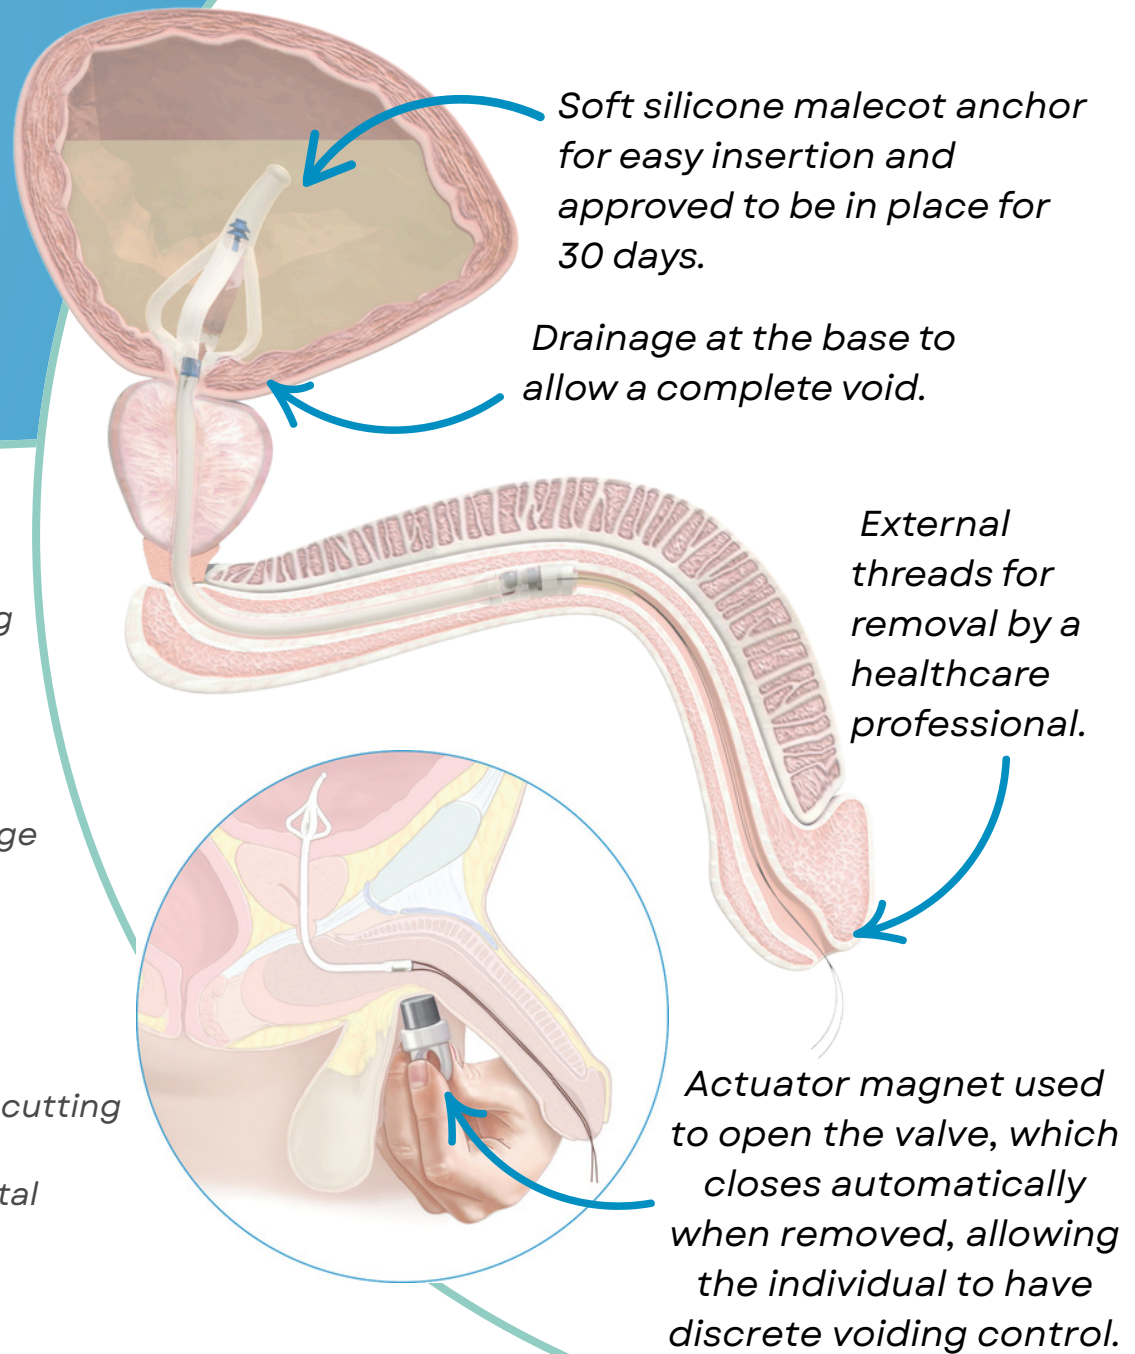

- Fully internal design eliminates the need for drainage bags or disposable supplies—only two fine threads remain externally visible.
- Allows users to urinate naturally using a simple, magnet-activated process.*

- Can remain in place for up to 30 days, significantly cutting down on single-use medical and packaging waste.
- Reduces the cost, inconvenience, and environmental impact of traditional catheter systems and aseptic routines.

cymactive™ requires insertion and removal by a medical professional, such as a urologist or nurse, with experience in the insertion and removal of urethral catheters.

* Non-neurogenic patients – manual dexterity is required for independent management of voiding.
