

Information for Clinical Choice

Electrosurgical Consumables and related Accessories

Support Document

Introduction

Information for Clinical Choice (ICC) has been developed to assist clinicians in the decision making process when assessing the suitability of a product by providing a clear illustration and description of the features of a range of similar products supplied through NHS Supply Chain.

The criteria provided, in the form of a Product Matrix and Support Document, is the result of a product / data review, conducted by the Clinical Engagement and Implementation Team, with support from clinical stakeholders from across the NHS. The aim, alongside delivering savings back into NHS frontline services, is to ensure that clinical choice remains at the forefront of any product switching decision.

Electrosurgical Handheld Pencil-Single Use Push Button

A sterile, single-use, handheld electrosurgical instrument designed for use in conjunction with an electrosurgical generator to cut, coagulate, desiccate, or fulgurate tissue. It typically comprises an insulated, pen-like body with an integrated electrode tip and one or more push-button controls that allow the operator to activate specific energy modes (e.g., cut and coagulation) directly at the surgical site.

Used across a wide range of surgical procedures, the device enables precise delivery of high-frequency electrical current to targeted tissue, facilitating controlled tissue dissection and haemostasis. The push-button configuration allows the surgeon to maintain continuous control without relying on a footswitch, supporting efficiency and ergonomic handling in the sterile field. Being single use, it reduces the risk of cross-contamination and eliminates the need for reprocessing.
