## Foley Catheter with Temperature Sensor

Support Document

### Introduction

Information for Clinical Choice (ICC) has been developed to assist clinicians in the decision-making process when assessing the suitability of a product by providing a clear illustration and description of the features of a range of similar products supplied through NHS Supply Chain.

The criteria provided, in the form of a Product Matrix and Support Document, is the result of a product review, conducted by Clinical Engagement and Implementation Managers with support from clinical stakeholders from across the NHS as part of our assurance process.

The aim, alongside delivering savings back into NHS frontline services, is to ensure that clinical choice remains at the forefront of any product switching decision.

### Patient Temperature Management: Foley Catheter with Temperature Sensor

A Foley catheter with temperature sensor enables the measurement of the temperature of urine inside the bladder, which does indicate the core body temperature accurately. The probes are available in a range of sizes as described in the matrices below, to meet adult and paediatric requirements. This type of Foley catheter has a temperature sensor which is an electrically insulated thermistor near the tip and a wire that connects the sensor to the temperature monitor.
