

# Information for Clinical Choice

## Silicone Wound Contact Layers

**Support Document** 

#### Introduction

Information for Clinical Choice (ICC) has been developed to assist Clinicians in the decision-making process when assessing the suitability of a product by providing a clear illustration and description of the features of a range of similar products supplied through NHS Supply Chain.

The criteria provided, in the form of a Product Matrix and Support Document, is the result of a product review, conducted by DHLs Clinical Procurement and Quality Assurance Team with support from clinical stakeholders from across the NHS as part of our assurance process.

The aim, alongside delivering savings back into NHS frontline services, is to ensure that clinical choice remains at the forefront of any product switching decision.

## **Advanced Wound Care: Wound Contact Layers**

Contact layer dressings are thin, non-adherent sheets designed to be placed on the wound bed to protect the tissue from direct contact with other agents or dressings. They conform to the shape of the wound and are porous to allow exudate to pass through for absorption by an overlying, secondary dressing.

WCLs require the use of a secondary dressing, and the clinician must consider the properties and interaction between both the selected WCL and the secondary dressing when providing care. This provides clinicians with a high level of flexibility and control to create the optimal environment for wound healing but may require a slightly elevated level of clinical expertise to be utilised most effectively. It is therefore also important to consider the overall value of treatment, rather than individual product cost.

### **Silicone Wound Contact Layers**

These WCLs include the use of silicone within the mesh itself, in order to minimise trauma on removal. They generally offer longer wear-times and a higher degree of compatibility with other dressings or treatments, including Negative Pressure Wound Therapy.

To be listed by NHS Supply Chain as an Antimicrobial product there must be evidence presented that the product can reduce bacterial load under laboratory conditions.
