

Information for Clinical Choice

Temperature Probe General Purpose

Support Document

Introduction

Information for Clinical Choice (ICC) has been developed to assist Clinicians in the decision-making process when assessing the suitability of a product by providing a clear illustration and description of the features of a range of similar products supplied through NHS Supply Chain.

The criteria provided, in the form of a Product Matrix and Support Document, is the result of a product review conducted by the clinical team in the Category Management Service Provider with support from clinical stakeholders from across the NHS as part of our assurance process.

The aim, alongside delivering savings back into NHS frontline services, is to ensure that clinical choice remains at the forefront of any product switching decision.

Patient Temperature Management: Temperature Probe General Purpose

A temperature probe can be defined as a type of sensor which is used to measure the patient's temperature. General purpose temperature probes can be used for oesophageal, nasopharyngeal, or rectal placement. They are used for routine monitoring of patient's core body temperature. They provide continuous temperature monitoring with accuracy, and they are highly sensitive which allows them to work well over a small temperature range.
