NHS Supply Chain

Information for Clinical Choice

Forced air warming paediatric over body blanket (single use)

Support document

Introduction

Information for Clinical Choice (ICC) has been developed to assist Clinicians in the decision-making process when assessing the suitability of a product by providing a clear illustration and description of the features of a range of similar products supplied through NHS Supply Chain.

The criteria provided, in the form of a Support Document, is the result of a product review conducted by the clinical team in the Category Management Service Provider with support from clinical stakeholders from across the NHS as part of our assurance process.

The aim, alongside delivering savings back into NHS frontline services, is to ensure that clinical choice remains at the forefront of any product switching decision.

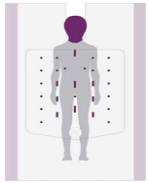

Patient Temperature Management - Forced air warming paediatric over body blanket (single use)

Forced air warming (FAW) blanket is designed to prevent hypothermia and keep patients at a normal core body temperature for use before, during and after surgical procedures. Blankets are used in conjunction with a FAW blower which is specific to each supplier. FAW systems deliver controlled warm air through a connecting hose into a quiltlike blanket that have small holes on one surface and warm air escaping through these holes provides conductive and convective warming to the patient, they are single patient use. Paediatric over body blanket is designed for use over a child to provide warmth.

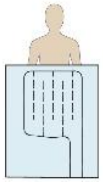

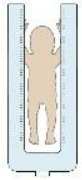

This ICC is one of a number that will look at different warming blankets to enable clinicians to make an informed decision when choosing products
