

Information for Clinical Choice

Suction Consumables - Yankauer Suction Catheter with Tubing

Introduction

Information for Clinical Choice (ICC) has been developed to assist clinicians in the decision-making process when assessing the suitability of a product by providing a clear illustration and description of the features of a range of similar products supplied through NHS Supply Chain.

The criteria provided, in the form of a Product Matrix and Support Document, is the result of a product / data review, conducted by the Clinical Engagement and Implementation Team, with support from clinical stakeholders from across the NHS. The aim, alongside delivering savings back into NHS frontline services, is to ensure that clinical choice remains at the forefront of any product switching decision.

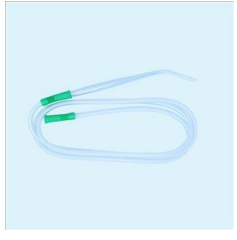

Yankauer Suction Catheter with Tubing

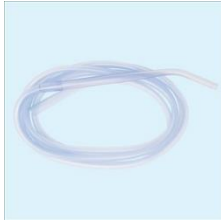

Yankauer suction catheters with tubing are hollow, atraumatic suction instruments designed for the safe and effective removal of secretions, fluids, or debris from the airway or surgical field. Manufactured from firm, durable materials, the rigid suction tip provides stable handling and precise control, while its smooth, rounded aperture enables efficient aspiration with minimal risk of tissue trauma. These devices are supplied pre-assembled with suction tubing, ensuring a secure connection to the suction source and delivering consistent, reliable performance throughout a procedure. The fixed shape of the Yankauer tip supports predictable access to the oropharynx, making this configuration particularly suited to high-demand clinical environments where stability, ease of use, and dependable suction are essential. Rigid Yankauer sets with tubing are available in both sterile and non-sterile formats to accommodate varying procedural and infection-control requirements.

A clear understanding of the purpose and functional characteristics of rigid Yankauer suction catheters with tubing is essential to making informed clinical choices. This document provides supporting information to help clinicians determine when a rigid Yankauer with tubing may represent the most appropriate option, ensuring device selection aligns with patient needs, procedural goals, workflow requirements, and safety considerations.
